

Notes for the use of `slrg` package

Arief Gusnanto*

April 15, 2026

This document can be found at this webpage: github.com/ariefgusnanto/slrg

The R package `slrg` is available from the GitHub page. The current package (version 1.0) is currently using slightly outdated functions. It is about to be updated, where more efficient functions will be included in the updated package. These more-efficient functions are available in the file `functions-GitHub.R` in the GitHub page, and will be compiled for the next version of the `slrg` package.

To illustrate the working of the (main) functions, the file `illustrations-GitHub.R` contains R commands to perform model fitting under the HLIG and HLIGnet models on the TCGA oesophageal cancer data. In the file, there are some notes on what R packages are needed. These model fitting has been tested on UNIX/Linux OS with 8 cores (user defined), 32 GB RAM, with BLAS installed (specifically, openblas).

The data used in the illustration is also available in the GitHub page, along with the steps taken for the preparation of the file from the GDC TCGA repository in UCSC Xena browser (file `preparation-GitHub.R`).
